

Task

Task: Shopify App

Step 1: Preparation

1. **Create a Partner Account:** Go to partners.shopify.com and sign up.
2. **Create a Development Store:** Inside your Partner Dashboard, create a store to test your work.
3. **Scaffold the App (Crucial):** Initialize the app as per [documentation](#).

Step 2: The Challenge (The App)

You need to build a system where data flows from: **Admin -> Database -> Shopify API -> Storefront**.

1. The App Dashboard (React/Polaris)

- Create a simple page in the Shopify Admin.
- Include a text input field: **"Announcement Text"**.
- Include a "Save" button.

2. The Backend & Database (Node/Express + MongoDB)

- When the user clicks "Save":
 - **Save to Database:** Store the text and a timestamp in your **MongoDB** database (to maintain an audit history).
 - **Sync to Shopify:** Your backend must use the Shopify Admin API (REST or GraphQL) to save this text into a **Shop Metafield**.
 - *Hint:* Use a namespace like `my_app` and a key like `announcement`.

3. The Storefront (Theme App Extension)

- Run `npm run shopify app generate extension` and select **Theme App Extension**.
- Create an **App Embed Block** (not a Section Block). This allows the banner to float on every page.
- **The Logic:** In the extension's liquid file, read the text from the Shop Metafield you saved in step 2 and display it.
 - *Hint:* You will use Liquid code similar to: `{{ shop.metafields.my_app.announcement }}`.

Step 3: Technical Requirements

Note: This is a confidential document not to be shared with anyone.

Task: Shopify App

- **Stack:** MongoDB, Express, React, Node.js (MERN).
- **Architecture:** Use the [shop.metafields](#) API to bridge the backend and frontend. **Do not** use ScriptTags (they are deprecated).
- **Repo:** Push your code to a public GitHub repository.

Step 4: Resources & Help

- **The Backend (Saving Data):** [Shopify Node API - Metafields](#)
- **The Frontend (Displaying Data):** [App Embed Blocks Guide](#)
- **The Bridge (Liquid):** [Accessing Metafields in Liquid](#)

Submission Guidelines

Email us the following on careers@futureblinkmail.xyz with subject line "Shopity App Developer Task".

1. **Public GitHub Repository Link:** With a [README.md](#) on how to run it.
2. **Deployed Application:** Use Render, Heroku, Linode, Vercel, Fly.io
3. **A Short Video Demo (Loom/YouTube):** A 2-3 minute video showing:
 - You typing a message in your App Dashboard (e.g., "Sale 50% Off") and clicking Save.
 - **The Proof:** Showing the message appearing live on the "Online Store" preview.
 - **The Database:** Showing the record saved in your MongoDB.
4. **Your Updated Resume**
